

KOALA Instructions

Check PyCharm Version

Make sure you are using the latest stable release of the **PyCharm IDE** (version 2025.3.3 as of March 8, 2026)

To check this:

- Click on the  to open the **Main Menu**
 - o On Mac, this will be in the top menu bar in **PyCharm -> About PyCharm**.
- Go to on Help -> About to get the below pop-up:

If it is not up-to-date, update your PyCharm installation by doing the following:

- Click on the  to open the **Main Menu**
- Go to **Help -> Check for Updates...**
 - o On Mac, this will be on the top menu bar

If you receive the following pop-up on the bottom of your screen, your PyCharm is already up-to-date:

Installing KOALA

To install **KOALA**, go to the [Google Drive](#) link provided to you.

- Download the **koala.zip** file and save it in a location where you can easily find it

Open your course project in PyCharm and install the plugin.

- Click on the  icon and select **Plugins...** to open the Plugins menu
- Click on the  icon in the Plugins menu and select **Install Plugin from Disk...**

- Locate **koala.zip** in the file explorer and click **OK**

- Click **Open**, and **Restart IDE** on the Plugins window to install **KOALA**

KOALA

JetBrains Research

Restart IDE 0.1.0

Overview

What's New

Reviews

Additional Info

TaskTracker-3 - a revolutionary plugin for collecting detailed data during education. The plugin collects various user activities during interactions with it, such as code snapshots with a certain granularity, all interactions with the interface, shortcuts, and so on. Extensive configuration options with config files that control its entire functionality make it very lightweight and easy to set up and use.

- After a few moments, you should receive a prompt to restart PyCharm to complete the installation. Click **Restart** to proceed.

- After restarting, **KOALA** will be installed.

Using KOALA

Survey

Once **KOALA** is installed, it will be accessible on the right side of PyCharm and can be found with this icon and  will look like the image below:

**Please enter
your PIN from
the survey**

PIN

☐ If you have not already done so,
please complete the survey on
[LimeSurvey](#) *

* - Required field

next

- In the first screen, you will be asked to enter your PIN from the survey you completed earlier. Please enter it in the field above and click **next**.

- The second screen is an explanation of purpose of the activity, review this and click **next** when you're ready

Understanding the Use of AI Assistants in Software Testing Activities

The aim of this activity is to help us gain an understanding on student use of AI Assistants during the software testing process. KOALA will anonymously record your activity during your activities during this process, use Continue as you usually would use your AI assistant.

next

Tasks

The next screen you will see is Task Selection screen. There are three tasks to complete and they are focused on two forms of code coverage you have seen in the course – statement and branch coverage and should be completed in order. This screen will tell you what task you will be working on.

- When you are ready to start the tasks, click **next**

The image shows a task selection interface. At the top, it says "Please select the task you would like to solve:". Below this, there is a label "Task:" followed by a dropdown menu. The dropdown menu is currently set to "Print Error Statement Coverage" and has a downward arrow icon. At the bottom of the screen, there is a light blue bar containing a white button labeled "next".

Please select the task you would like to solve:

Task: Print Error Statement Coverage ▼

next

Sample Task

- The sample task is a simple example of what statement coverage could look like with a calculator program. It serves as a basic reference of what unit tests should generally look like using pytest. Your tests should be more detailed than these.

test_sample.py × sample.py

1 import pytest ✓

2 from sample import add, subtract, divide, is_even

3

4

5 ▶ def test_add():

6 assert add(a: 2, b: 3) == 5

7

8

9 ▶ def test_subtract():

10 assert subtract(a: 10, b: 4) == 6

11

12

13 ▶ def test_divide():

14 assert divide(a: 10, b: 2) == 5.0

15

16

17 ▶ def test_divide_by_zero():

18 with pytest.raises(ValueError, match="Cannot divide by

19 divide(a: 5, b: 0)

20

21

22 ▶ def test_is_even_true():

23 assert is_even(4) is True

24

25

26 ▶ def test_is_even_false():

27 assert is_even(7) is False

Statement Coverage Sample

Sample Task - Statement Coverage: This task is a sample for reference only to show what a basic Python unit test using pytest looks like.

Statement Coverage: Causes every statement in the program to be executed at least once, giving us confidence that every statement is at least capable of executing correctly.

System: Make a test case for each statement in the program, independent of the others.

Completion criterion: A test case for every statement.

Note: You only need to do statement coverage for the provided code for this study.

When you are done the task, please back up the file in a separate location before submitting it.

The files can be found in the tasktracker directory.

You will need to import print_error.py and pytest.

pause

next

Solving a Task

- When you are solving a task, please prevent leaving comments such as your name and student number and write your code below the comment # Write your code here
- You can write and execute the code without interruption, and can also use Continue as you usually would with an AI Assistant
- The starter code, which is the same as the starter code provided for Phase 4 will also be provided for you and available in another tab.

NOTE: When you are done the task, please make sure to back up your file in a separate location before submitting it. The files can be found in the **tasktracker** directory in the root of the project.

Print Error Statement Coverage

Statement Coverage: Causes every statement in the program to be executed at least once, giving us confidence that every statement is at least capable of executing correctly.

System: Make a test case for each statement in the program, independent of the others.

Completion criterion: A test case for every statement.

Note: You only need to do statement coverage for the provided code for this study.

When you are done the task, please back up the file in a separate location before submitting it.

The files can be found in the tasktracker directory.

You will need to import print_error.py and pytest.

pause

next

To submit the code, click **next** in **KOALA**. This will return you to the task selection. Repeat this process for all three tasks.

Uninstalling KOALA

Once the tasks have been completed, you can uninstall **KOALA**.

- Click on the  icon at the top of PyCharm and select **Plugins...** and switch to the **Installed** tab

You will see KOALA in the list of plugins

- On each of the plugins, click the  and select **Uninstall**

After the plugin has been uninstalled, click on **Restart IDE** and then **Restart** to complete the uninstallation process.

Click **Restart** to restart PyCharm. When it reloads, **KOALA** will be removed from PyCharm.
