

KOALA Server Setup Guide

SEER Lab repository link: <https://github.com/seer-lab/code-tracking>

- Use the daniel-koala branch

JetBrains repository link (for reference): <https://github.com/JetBrains-Research/KOALA>

Prerequisites:

- JDK 21 or later (recommended)
- Docker
- PostgreSQL

PostgreSQL

- Database name: koala
- I will need access to the database for data analysis

Server

- The Docker image is built locally and can be created with the following command
`docker build --platform linux/amd64 -t koala-server .`
- Dockerfile is also in the project root if changes are necessary
- The database user credentials will need to be added to docker-compose.yml in the project root.
- Start the Docker server with `docker compose up`
- Please provide the server URL the plugin would connect to
